

02 / AI VOICE

More calls. More upsells. Less interruption.

Maistro AI Voice, launched with AWS, takes as many calls as needed at the same time, takes orders and offers relevant upsells. It can identify phone numbers and addresses, with guardrails for rogue orders. Your team keeps service moving while AI handles the phones.

Upselling built into the conversation

A side, a drink or an extra topping: AI Voice offers relevant additions while taking the order. Each call is a chance to help customers complete their meal and increase order value, with the choice always theirs.

As many calls as needed, at once

The dinner rush does not have to become a queue for the phone. Maistro AI Voice handles as many simultaneous calls as needed, taking menu choices while your team serves the customers in front of them.

Phone number and address identification

AI Voice can identify phone numbers and addresses as part of the ordering conversation, helping capture the customer details needed for the order.

Guardrails for rogue orders

Built-in guardrails help protect the ordering flow from rogue orders. We agree the checks and handling rules for your operation, including when your team should step in.

Customer order support

Voice also helps customers with their orders. Connected order information and the agreed handover process determine which queries it can resolve and when a person needs to step in.

One telephone-ordering team for multiple stores

For businesses with a central call team, one team can take orders for multiple stores and route each order to the right kitchen. This staffed workflow sits alongside Maistro's AI Voice service.

Voice is launched with AWS. We'll agree your menu, upsell options, order guardrails and handover arrangements together.
